

PRODUCT DIMENSIONS

Most of the products in this catalog have dimensional information listed to guide the buyer or user in product selection. As many of the products' illustrations show just one size or configuration of that product, this dimensional information is important to understand. Please take notice if the dimensions are listed in English (inches) or Metric (mm).

Of all the dimensions listed in this catalog, one may require a little explaining: OAL or Over All Length. This dimension is critical in determining heights and distances when assembling the products with each other. Traditionally, OAL is used to show the longest dimension of a product, from end to end, or from top to bottom. This is true with many of the products in this catalog, however, there are a few products where this rule is different. These products are those with interchangeable joints on both ends. In this case the OAL dimension is taken from "top of grind to top of grind", meaning that the dimension is taken from the same or mating point on each joint. See examples below.
